

APPLICATION KNOWLEDGE BASE

Rent Renewal Tracker

Complete User Manual, Operations Guide, Permissions Reference and Field Catalogue

Frappe Framework v16 application | Application version 0.2.0

Prepared 18 July 2026

Purpose: enable a new user, approver, auditor, or administrator to understand and operate every user-facing feature of the application without relying on undocumented institutional knowledge.

How to use this knowledge base

Start with Sections 1-6 for orientation and setup. Operational users should then study leases, documents, payments, and lifecycle requests. Approvers should focus on the workflow and permissions chapters. Administrators and auditors should also study reminders, automation, reporting, security controls, and the field catalogue.

Authoritative scope: This manual is derived from the application source in this workspace as of 18 July 2026. It documents implemented behavior. Site-specific Frappe configuration, custom roles, email accounts, print formats, and future code changes may alter what an individual user sees.

Contents at a glance

- Purpose, scope, roles, access, and workspace navigation
- Implementation setup and readiness checks
- Master data: departments, properties, and landlords
- Lease creation, submission, status logic, calendar, and lifecycle actions
- Private lease documents, expiry monitoring, and immutable revisions
- Rent schedules, payment evidence, status derivation, and calendar
- Renewal and termination workflow, approvals, execution, and successor leases
- Reminder policies, recipient resolution, delivery, retries, logs, and weekly digest
- Dashboard cards, My Actions, reports, charts, filters, and interpretation
- Security model, role permissions, confidentiality clearance, and department scoping
- Troubleshooting, operating controls, glossary, and complete field catalogue

1. Purpose

Rent Renewal Tracker is a Frappe-based application for managing the full lease lifecycle from property setup to lease monitoring, rent payment scheduling, renewal approvals, supporting documents, and reminder delivery.

This guide explains how end users can work with the application from the Rent Renewal Tracker workspace in the app menu.

2. What the App Covers

The application helps teams:

- Register properties, landlords, and lease departments.
- Create and maintain lease records.
- Track notice deadlines, expiry dates, next action dates, and occupancy cost.
- Store private lease-related documents.
- Manage rent schedules and payment follow-up.
- Run a controlled multi-stage lease renewal approval process.
- Send automated pre-expiry and overdue reminders.
- Review operational reports for expiries, renewals, payments, exposure, and reminder delivery.

3. Access and Roles

Access to screens and actions depends on user role. The main roles used by the app are:

- Rent Renewal System Manager: Full setup, configuration, and administrative access.
- Lease Administrator: Maintains operational records and can complete approved renewals.

- Responsible Officer: Creates and manages leases, rent schedules, documents, and renewal requests.
- Department Head: Reviews and returns or approves renewal requests at department stage.
- Finance Approver: Reviews and returns or approves renewal requests at finance stage.
- Legal Approver: Reviews and returns or approves renewal requests at legal stage.
- Management Approver: Gives final approval or rejection.
- Lease Auditor: Read-only audit and report access.
- Lease Viewer: Basic read-only access.

If a menu item is missing, the usual cause is role-based permission rather than a system error.

Role permission makes a DocType available, while record-level authorization determines which specific records the user may open or change. Lease assignment, Lease Department User Permissions, and confidentiality clearance are rechecked when a record is opened or saved.

4. Opening the App

After signing in to Frappe:

1. Open the app launcher or desk menu.
2. Select Rent Renewal Tracker.
3. The workspace opens with four shortcuts:
 - Leases
 - Renewals
 - Payments
 - Documents

The dashboard also shows permission-aware cards for upcoming expiries, renewals waiting for the current user, overdue rent, failed reminders, and annual rent exposure. Select a card to open the corresponding filtered report.

The workspace also groups links under three sections:

- Operations
- Registers and Setup
- Reports

5. Workspace Navigation

Operations

Use this section for day-to-day records:

- My Actions
- Leases
- Renewal Requests
- Rent Schedules
- Lease Documents

Registers and Setup

Use this section for master data and reminder controls:

- Setup Readiness
- Properties
- Landlords
- Lease Departments
- Reminder Policies
- Reminder Logs
- Settings

Reports

Use this section for monitoring and management review:

- Upcoming Expiries
- Renewal Pipeline
- Upcoming Payments

- Rent Exposure
- Reminder Delivery

6. Recommended Setup Sequence

For a new implementation, create records in this order:

1. Lease Departments
2. Properties
3. Landlords
4. Rent Renewal Settings
5. Reminder Policies if the default policy needs adjustment
6. Leases
7. Lease Documents
8. Rent Schedules

This order reduces lookup errors while creating transactional records.

Use Setup Readiness to confirm that departments, assigned users, a reminder policy, outgoing email, properties, and leases are configured. The weekly management digest is optional and is enabled from Rent Renewal Settings after valid recipient email addresses are entered.

7. Master Data Setup

7.1 Lease Departments

Open Registers and Setup > Lease Departments to maintain the list of departments responsible for leases.

Important fields:

- Department Name
- Department Code
- Disabled
- Description

Use department records to assign operational ownership on properties and leases.

7.2 Properties

Open Registers and Setup > Properties to register each leased or managed location.

Important fields:

- Property Name
- Property Type
- Active
- Address, City, State, Country, Region
- Latitude, Longitude
- Responsible Department
- Default Responsible Officer
- Occupancy Status
- Notes

Tips:

- Keep the Region field consistent because it is reused in lease reporting.
- Assign a default department and officer where possible to simplify lease setup.

7.3 Landlords

Open Registers and Setup > Landlords to create landlord or lessor records.

Important fields:

- Legal Name
- Registration / Tax Identifier
- Active
- Contact Name
- Email
- Phone

- Address
- Preferred Currency
- Compliance Notes

Use Compliance Notes for legal or vendor-risk remarks where that permission level is available.

8. Application Settings

Open Registers and Setup > Settings to manage default behavior.

Important settings:

- Default Reminder Policy
- Expiring Soon Threshold (Days)
- Default Currency
- Timezone
- Email Sender
- Reminder Retry Limit
- Administrator Error Recipients
- Create Renewal Request at First Threshold

How these settings work:

- Expiring Soon Threshold controls when active leases are automatically classified as expiring soon.
- Reminder Retry Limit controls how many times the system retries a failed reminder delivery.
- Administrator Error Recipients receives failure alerts when reminder delivery cannot be completed.
- Create Renewal Request at First Threshold allows the system to open a renewal request automatically at the earliest enabled threshold.

9. Reminder Policies

Open Registers and Setup > Reminder Policies to configure reminder timing, channels, and recipients.

Important fields:

- Policy Name
- Enabled
- Reminder Thresholds
- Overdue Cadence (Days)
- Email Enabled
- System Notification Enabled
- Recipients
- Subject Template
- Message Template

Reminder Thresholds

Each threshold row defines how many days before expiry a reminder should be triggered. A default installation creates thresholds at:

- 90
- 60
- 30
- 14
- 7
- 0

Recipients

Recipient rows support:

- Lease User Field
- Lease Contact Type
- Role
- Explicit User
- Email

Scope can be:

- All

- Pre-Expiry
- Expiry
- Overdue

Example:

- Send all reminders to the responsible_officer.
- Send overdue reminders to the backup_officer.
- Send legal-stage reminders to contacts tagged as Legal.

10. Creating and Managing Leases

Open Operations > Leases.

10.1 Create a New Lease

1. Click Add Lease.
2. Complete the key sections.
3. Save the record.

The save operation applies both the role permission and the record-level lease scope:

- Rent Renewal System Manager and Lease Administrator may create a Lease without being assigned to it because they are unrestricted operational roles.
- A Responsible Officer may create a Lease only when the new record assigns that user as Responsible Officer, Contract Owner, or Backup Officer, or the user has a matching Lease Department User Permission. The selected confidentiality classification must also be within the user's clearance.

Lease Documents, Rent Schedules, Renewal Requests, and Reminder Logs repeat the parent Lease authorization check through their required Lease link. Lease Documents additionally enforce their own Confidentiality field, so access must pass both the parent Lease classification and the linked document classification.

10.2 Lease Identity Section

Core fields:

- Lease Title
- Property
- Landlord
- Lease Type
- External / Contract Reference

The system names leases automatically using the pattern LEASE-.YYYY.-#####.

10.3 Ownership Section

Use this section to assign accountability:

- Responsible Department
- Responsible Officer
- Contract Owner
- Backup Officer
- Reminder Policy
- Lease Contacts

The Region field is auto-filled from the selected property.

Responsible Officer versus Contract Owner

The Responsible Officer is the required day-to-day operational owner of the lease. This user is the primary person expected to monitor dates, maintain the lease and its related records, initiate lifecycle action, and respond to reminders. The default reminder policy sends all lease-expiry reminders to this field, and operational views use it when identifying the officer responsible for an expiring lease.

The Contract Owner is an optional additional accountable user for the underlying commercial or business relationship. Use it when business ownership sits with a different person from the officer performing routine lease administration—for example, a business-unit sponsor, property portfolio owner, or contract relationship lead. A Contract Owner receives record access to the lease and its related renewal requests, rent schedules, documents, and reminder logs. Reminder policies may also target the contract_owner field when explicitly configured.

The application does not assign a separate approval stage or automatic reminder to the Contract Owner merely because the field is populated. Workflow authority still comes from the approver's role and lease access. If the same

person performs both functions, enter that user as Responsible Officer and leave Contract Owner blank, or enter the same user in both fields if your reporting convention requires explicit business ownership.

10.4 Lease Contacts

Contacts are entered in a child table with:

- Contact Type
- Name
- Organization
- Email
- Phone
- Receives Reminders
- Notes

Contact types include Landlord, Legal, Facility, Finance, Escalation, and Other.

Use the Receives Reminders checkbox for contacts who should be eligible when the reminder policy uses Lease Contact Type.

10.5 Term Section

Important fields:

- Start Date
- End Date
- Notice Period (Days)
- Renewal Option
- Renewal Option Deadline
- Break Clause Date
- Auto Renew

System-calculated fields:

- Notice Deadline
- Days to Expiry
- Next Action Date

The system calculates:

- Notice Deadline as End Date - Notice Period.
- Days to Expiry from the current date.
- Next Action Date as the earliest of notice deadline, renewal option deadline, or break clause date.

10.6 Financial Terms Section

Important fields:

- Currency
- Rent Basis
- Monthly Rent
- Annual Rent
- Payment Frequency
- Security Deposit
- Annual Service Charge
- Annual Tax
- Escalation / Indexation Rule

System-calculated field:

- Total Annual Occupancy Cost

If Rent Basis is Monthly and Monthly Rent is entered, the system calculates Annual Rent automatically.

10.7 Status Section

Lease status values include:

- Draft
- Active
- Expiring Soon
- Renewal in Progress
- Renewed

- Expired
- Terminated

Renewal status values include:

- Not Started
- Draft
- Pending Approval
- Approved
- Rejected
- Completed
- Not Renewing

Several status values are controlled automatically by date logic and workflow progress.

10.8 Validation Rules

The system prevents:

- End dates earlier than or equal to start dates.
- Negative notice periods.
- Negative monetary values.
- Active leases without core ownership, date, currency, and rent information.
- A new lease, or a change to a lease property, term, or ongoing status, when its

dates overlap another ongoing lease for the same property. Existing legacy conflicts are marked Overlap Review Required so unrelated corrections remain possible while an administrator resolves the conflict.

10.9 Resolving an Existing Overlap

Do not delete or automatically terminate either lease based only on the overlap flag.

Review the signed agreements and supporting evidence first, then use the appropriate resolution:

1. Complete the termination or cancellation of the lease that is no longer ongoing.
2. Correct an inaccurate Property, Start Date, or End Date on the incorrect record.
3. If both agreements are valid for distinct rentable units, create or select the correct

unit-level Property records rather than keeping both against one Property.

An unrelated correction remains allowed while review is pending. A change that keeps an overlapping lease ongoing is blocked. The daily status refresh synchronizes the review flags after the underlying conflict is resolved.

11. Lease Documents

Open Operations > Lease Documents to store private contractual evidence against a saved Lease. Lease Document now follows Frappe's standard Draft, Submit, Cancel, and Amend lifecycle.

Important fields include Lease, Lifecycle Request, Title, Category, Private File, document dates, expiry information, Confidentiality, revision fields, Cancellation Reason, and Amended From.

11.1 Layered Access and Linked-Lease Permission

Lease Document access is never determined by its role permission alone. Every read, create, write, submit, cancel, revision, and file-download decision is the intersection of:

- The user's Lease Document DocType permission for the requested action.
- Access to the linked saved Lease.
- Assignment through the Lease's Responsible Officer, Contract Owner, or Backup Officer, or a matching Lease Department User Permission.
- The parent Lease's Confidentiality Classification clearance.
- The Lease Document's own Confidentiality clearance.
- Permission to use and read the private File record.

A Lease Department User Permission must use Allow = Lease Department, a For Value matching the Lease's Responsible Department, and Applicable For = Lease or blank. Being mentioned as a contact or approver does not grant create, write, submit, or cancel permission by itself.

Rent Renewal System Manager and Lease Administrator are unrestricted operational roles for the linked-Lease scope. Administrator retains Frappe's permission bypass. System Manager bypasses the record-level scope filter but still needs an applicable Lease Document DocType grant for the requested action.

11.2 Confidentiality Clearance

The parent Lease and child document classifications are checked separately, and the stricter result wins:

- Responsible Officer, Department Head, and Finance Approver have clearance through Confidential.
- Legal Approver, Management Approver, and Lease Auditor have clearance through Restricted.
- Lease Viewer is limited to Public/Internal parent leases and Internal Lease Documents.
- Multiple roles combine their DocType grants and confidentiality clearances, but assignment or department scope still applies to scoped users.

For example, a user with Responsible Officer plus Legal Approver receives create/submit authority from Responsible Officer and Restricted clearance from Legal Approver, but can act only on an assigned Lease or one covered by the matching Lease Department User Permission.

11.3 Who Can Create and Save a Draft?

Under the default permission matrix:

- Administrator, Rent Renewal System Manager, and Lease Administrator can create Lease Documents for any accessible saved Lease.
- Responsible Officer can create a document only for a Lease within the user's assignment or department scope and confidentiality clearance.
- Department Head, Finance Approver, Legal Approver, Management Approver, Lease Auditor, and Lease Viewer are read-oriented and cannot create with only those roles.
- A custom role can create only when it has explicit Lease Document Create permission and the user also passes linked-Lease scope and confidentiality checks.

A newly saved record remains Draft; saving alone does not make it contractual evidence and does not supersede an earlier revision. While it is a true Draft, its file and metadata may be corrected. Only users whose role includes Delete can delete it; by default that is the two operational manager roles. Responsible Officer can create and edit Drafts but cannot delete them.

11.4 Who Can Submit, and What Does Submission Do?

Default submit authority is:

- Administrator: may submit through Frappe's permission bypass.
- Rent Renewal System Manager: may submit.
- Lease Administrator: may submit.
- Responsible Officer: may submit only when the linked Lease and document are within the user's scope and clearance.
- All review-only, audit, and viewer roles: no submit permission by default.

A user with a custom role may submit only if that role has explicit Lease Document Submit permission and the user also passes linked-Lease and confidentiality authorization.

Before submission, the file must be private and permitted, the linked Lifecycle Request (if supplied) must belong to the same Lease, and formal evidence categories (Signed Agreement, Addendum, Renewal Letter, Approval, Payment Receipt, and Valuation) must have a Document Date.

Submission changes the revision from Draft to Current, records Revised By and Revised On, calculates the expiry status, and locks the evidence file against in-place replacement. When submitting a new revision, only then is the previous current revision changed to Superseded. This prevents an unfinished Draft from displacing valid evidence.

11.5 Creating a Normal Revision

Open a submitted Current document and select Create Revision. The action is also available from a legacy current record for migration compatibility. It requires Lease Document create permission and write access to the current record.

The new revision must:

- Remain linked to the same Lease.
- Use a different private file.
- Include a Revision Reason.
- Branch from the current submitted or legacy-current revision.

The new record remains Draft until an authorized user submits it. Its family ID is retained and its revision number increases. On submission, the new revision becomes Current and the prior revision becomes Superseded. A Superseded revision cannot be used as a branch and cannot be cancelled.

11.6 Who Can Cancel, and What Does Cancellation Do?

Default cancellation authority is deliberately narrower than submit authority:

- Administrator, Rent Renewal System Manager, and Lease Administrator can cancel.
- Responsible Officer can submit but cannot cancel; cancellation must be escalated to an operational manager.
- Review-only, audit, and viewer roles cannot cancel.
- A custom role needs explicit Lease Document Cancel permission and must still pass linked-Lease and confidentiality authorization.

Only the submitted Current revision can be cancelled. Enter and save a meaningful Cancellation Reason before selecting Cancel. The cancelled record remains retained as evidence with DocStatus Cancelled, Revision Status Cancelled, and Document Status Cancelled; it is not deleted. If it replaced an earlier revision, the application restores that immediate Superseded predecessor to Current, provided no conflicting current revision exists.

11.7 Amending a Cancelled Lease Document

After cancellation, use Frappe's standard Amend action. Frappe creates a new Draft and automatically sets Amended From to the cancelled record, resolving the earlier amendment error.

An amendment must remain on the same Lease and include a Revision Reason. It stays in the same document family and receives the next revision number. An amendment may reuse the cancelled file when the correction concerns metadata; a normal revision must use a different file. The amendment becomes effective only after an authorized user submits it. If the cancelled document had replaced an earlier revision, submission of the amendment supersedes the predecessor that cancellation restored.

11.8 Evidence Integrity, Expiry Automation, and Legacy Records

Submitted, Cancelled, Superseded, and legacy records cannot be deleted or have their file replaced in place. Use revision or amendment instead. Daily expiry automation and the My Actions report ignore Draft and Cancelled records; submitted Current documents continue to receive No Expiry Date, Current, Expiring Soon, or Expired attention states.

During upgrade, existing Current or Superseded records are marked internally as Legacy Unsubmitted rather than being silently submitted. They remain readable, revisable, and valid for existing renewal-completion evidence. An authorized user may review and submit a legacy record later; submission preserves its Current or Superseded revision state and removes the legacy marker. The migration also aligns app-managed Custom DocPerm rows so existing sites receive the same submit/cancel grants as new installations without replacing unrelated custom permissions.

11.9 Renewal and Termination Evidence

A Renewal Request can be completed only when the exact request and Lease have a dated, private, Current supporting document:

- Renewal Letter for Renew, Renegotiate, or Relocate.
- Approval for Terminate.

For new records, that Current document must be submitted. A legacy Current record is accepted for backward compatibility. Draft, Superseded, and Cancelled documents cannot satisfy the completion requirement.

12. Rent Schedules and Payment Tracking

Open Operations > Rent Schedules.

Use rent schedules to track planned payment obligations by lease and period.

12.1 Key Fields

- Lease
- Description
- Period From
- Period To
- Due Date
- Currency
- Base Rent
- Service Charge

- Tax
- Total Due
- Payment Status
- Schedule Status
- Payments
- Total Paid
- Outstanding Balance
- Payment Reference
- Paid On
- Notes

12.2 System Behavior

The system calculates Total Due as:

- Base Rent + Service Charge + Tax

For a new schedule, Fetch Lease Financials fills only blank amounts. Monthly and Annual rent bases are converted to an installment amount using the lease's Monthly, Quarterly, Semi-Annual, or Annual payment frequency. Per Square Metre, Fixed Term, Other rent bases, and an Other payment frequency remain manual so the system does not guess a commercial amount.

Use Record Payment to add each receipt. The system totals the payment history, shows the outstanding balance, and keeps the schedule Partially Paid until the full amount is recorded.

The system also derives Schedule Status automatically:

- Planned if due date is in the future
- Due if due today
- Overdue if due date has passed and not settled
- Partially Paid if a balance remains after one or more payments
- Paid if payment status is Paid
- Waived if payment status is Waived
- Cancelled if the record is cancelled

12.3 Validation Rules

The system prevents:

- Period end before period start
- Rent periods outside the parent lease start and end dates
- Negative amounts
- Empty schedules with all zero amounts
- Currency mismatch between schedule and lease
- Overlapping schedule periods for the same lease
- Payments that are zero, negative, missing evidence, or exceed Total Due

12.4 Upgrade and Reconciliation Behavior

During upgrade, an existing Paid schedule receives one historical payment row for its full Total Due. The migration retains the legacy payment date and reference where available and uses a clearly identified migration fallback only when they were absent.

An existing Partially Paid schedule is marked Payment Reconciliation Required; the migration does not guess the amount already paid. Review the available receipt or bank evidence and use Record Payment to capture the supported amount. The schedule then derives Total Paid, Outstanding Balance, Payment Status, and Schedule Status from its payment history.

13. Renewal Request Workflow

Open Operations > Renewal Requests.

Use this screen to manage structured lease renewal decisions and approvals.

13.1 Who Can Start a Lease Renewal?

Under the application's default Renewal Request permissions:

- Administrator can create a Renewal Request for any Lease.
- Rent Renewal System Manager and Lease Administrator can create a Renewal Request without Lease assignment, department-scope, or confidentiality restrictions.
- Responsible Officer can create a Renewal Request only for a Lease within the user's assignment or Lease Department scope and confidentiality clearance.
- System Manager by itself cannot create a Renewal Request. Record-level filter bypass does not grant the Renewal Request create permission that is absent from the default DocType permission matrix.
- Department Head, Finance Approver, Legal Approver, Management Approver, Lease Auditor, and Lease Viewer cannot create a Renewal Request with only those roles.

The recommended operational path is:

1. Open a submitted Lease.
2. Open the Lifecycle menu.
3. Select Start Renewal.
4. Complete the proposed terms and recommendation in the generated Draft.
5. Save the request.
6. Use Submit for Department Review.

The Start Renewal action accepts only submitted Leases whose status is Active, Expiring Soon, or Expired. If an open renewal request already exists, the existing request opens. If an open termination request exists, it must be completed or cancelled first.

Create-enabled users can also use Add Renewal Request from the Renewal Request list. The current application applies the submitted/status eligibility check through the Start Renewal action, not through direct list creation, so operational users should use the Lease lifecycle action as the standard entry point.

The system automatically:

- Assigns the next Renewal Sequence.
- Captures a snapshot of the current lease terms.
- Defaults proposed values from the current lease.
- Fills Requested By and Requested On.

If Create Renewal Request at First Threshold is enabled in Rent Renewal Settings, the reminder engine may create a Draft automatically at the first configured reminder threshold. Human create permission is not used for that background action, but all subsequent record-scope and workflow-stage controls continue to apply.

13.2 Exact Linked-Lease Requirements

A user relying on the Responsible Officer role must satisfy at least one of these scope conditions:

- The user's account is entered in the Lease's Responsible Officer.
- The user's account is entered in Contract Owner.
- The user's account is entered in Backup Officer.
- The user has a Frappe User Permission with Allow set to Lease Department, For Value matching the Lease's Responsible Department, and Applicable For set to Lease or left blank.

A Responsible Officer alone has clearance for Public, Internal, and Confidential Leases, but not Restricted Leases. Frappe combines role clearances, so a Responsible Officer who also has Legal Approver, Management Approver, Lease Auditor, or an unrestricted operational role can receive Restricted clearance.

The same linked-Lease authorization is required for every scoped workflow approver. A workflow role does not by itself grant access to the Renewal Request. The approver must also be assigned to the Lease or hold the matching Lease Department User Permission and must have sufficient confidentiality clearance.

13.3 Workflow States

The renewal process follows this sequence:

1. Draft
2. Department Review
3. Finance Review
4. Legal Review
5. Management Approval
6. Approved
7. Completed

Possible exit state:

- Rejected

13.4 Who Acts at Each Stage

- Draft: Responsible Officer edits the proposal. Responsible Officer or Lease Administrator can submit it for Department Review.
- Department Review: Department Head can approve to Finance Review or return the request to Draft.
- Finance Review: Finance Approver can approve to Legal Review or return the request to Draft.
- Legal Review: Legal Approver can approve to Management Approval or return the request to Draft.
- Management Approval: Management Approver can approve the request or reject it.
- Approved: Lease Administrator can use Mark Executed to complete the renewal.

Administrator can perform all stages. Rent Renewal System Manager has broad Renewal Request DocType permissions and unrestricted record scope, but that role alone is not listed for a workflow transition. The user must also hold the role assigned to the current workflow action. Likewise, Lease Administrator can submit a Draft and execute an Approved request, but cannot replace the Department, Finance, Legal, or Management approver without also holding that stage's role.

Important control:

- The original requester cannot approve their own review stage.
- Return and Reject require a workflow comment.
- Role permissions and confidentiality clearances are combined when a user has multiple roles.
- Department Head and Finance Approver have clearance through Confidential. Acting on a Restricted Lease requires an additional role that supplies Restricted clearance or an unrestricted operational role.
- Legal Approver and Management Approver have Restricted clearance but still require Lease assignment or department scope unless they also hold an unrestricted operational role.

13.5 Proposal and Recommendation Fields

Important fields include:

- Proposed Property
- Proposed Start Date
- Proposed End Date
- Proposed Notice Date
- Proposed Currency
- Proposed Rent Basis
- Proposed Monthly Rent
- Proposed Annual Rent
- Proposed Payment Frequency
- Proposed Escalation Rule
- Recommendation
- Business Justification
- Risk Assessment
- Budget Impact
- Alternative Options

Recommendation values:

- Renew
- Renegotiate
- Relocate
- Terminate

13.6 Workflow Comments and Decision History

Use Workflow Comment whenever context is needed.

The system requires a comment when:

- Returning a request
- Rejecting a request

Every valid transition is written to Decision History with:

- from state
- action
- to state
- actor
- action date/time
- comment

13.7 Completion Behavior

When a request moves to Completed:

- The system checks that proposed lease dates exist.
- A submitted Current private Renewal Letter Lease Document must be linked to the same Lease and the exact Renewal Request and must have a Document Date. A legacy Current record is accepted for upgrade compatibility; Draft, Superseded, and Cancelled records are not.
- If the recommendation is not Terminate, the system creates a successor lease automatically if one does not already exist.
- The successor lease carries forward the main lease structure and uses the approved proposed terms.

Only Lease Administrator can perform the configured Mark Executed transition. Completing a termination uses a submitted Current private Approval document instead of a Renewal Letter, with legacy Current evidence accepted only for upgrade compatibility.

13.8 Open-Cycle Control

Only one open renewal request is allowed per lease at a time. The system blocks creation of another active cycle until the previous one is completed, rejected, or cancelled.

13.9 Current Interface and Workflow Limitations

- The Lease form currently displays Start Renewal based on Lease status and submission state rather than checking Renewal Request create permission. A read-only user may see the button, but the server rejects unauthorized creation.
- Rent Renewal System Manager can create a Renewal Request but cannot progress it through workflow transitions with that role alone.
- Direct Add Renewal Request creation does not use the same submitted/status eligibility gate as the recommended Start Renewal lifecycle action.

14. Automated Status Updates

The app runs daily background jobs that:

- Refresh lease status and date-derived values.
- Refresh unpaid rent schedule statuses.
- Process due reminders.

This means:

- Days to Expiry stays current.
- Expiring Soon, Expired, and Active statuses update automatically.
- Planned, Due, and Overdue schedule statuses update automatically.

15. Reminder Processing

The reminder engine monitors leases that:

- are not Draft, Renewed, or Terminated
- are not in renewal status Completed or Not Renewing
- have an End Date

When a threshold is reached, the system:

1. Resolves the active reminder policy.
2. Determines whether that threshold is due.
3. Optionally creates a renewal request automatically at the first threshold.
4. Creates reminder log records.
5. Queues email and or in-app notification delivery.
6. Retries failed deliveries up to the configured retry limit.

After successful delivery, the lease updates:

- Last Reminder Date
- Next Reminder Date

16. Reports

16.1 Upcoming Expiries

Use this report to identify leases ending within a date range.

Helpful fields shown:

- Lease
- Title
- Property
- Landlord
- Department
- Officer
- End Date
- Days to Expiry
- Lease Status
- Renewal Status
- Next Action

Use it for weekly renewal planning and operational review meetings.

16.2 Renewal Pipeline

Use this report to track every renewal request in progress or completed.

Helpful fields shown:

- Renewal
- Lease
- Cycle
- Workflow State
- Pending With
- Age (Days)
- Recommendation
- Requested By
- Requested On
- Proposed Start and End
- Proposed Annual Rent

Use it to identify approvals that are ageing or stuck at a stage.

16.3 Upcoming Payments

Use this report to monitor unpaid obligations within a date range.

Helpful fields shown:

- Schedule
- Lease
- Description
- Period
- Due Date
- Days
- Currency
- Base Rent
- Service Charge
- Tax
- Total Due
- Status

By default, it excludes Paid, Waived, and Cancelled entries unless filters are changed.

16.4 Rent Exposure

Use this report for financial visibility across active and expiring leases.

Helpful fields shown:

- Lease

- Title
- Property
- Landlord
- Region
- Department
- Currency
- Monthly Rent
- Annual Rent
- Service Charge
- Tax
- Total Annual Cost
- Status
- End Date

If multiple currencies exist and no currency filter is applied, totals should be reviewed per currency rather than combined.

16.5 Reminder Delivery

Use this report to audit reminder operations.

Helpful outputs:

- Reminder log list
- Delivery status counts
- Donut chart of Queued, Sent, and Failed
- Delivery rate summary

Helpful fields shown:

- Log
- Lease
- Renewal
- Policy
- Threshold
- Scheduled Date
- Channel
- Recipient
- Status
- Sent At
- Retries
- Error

17. Common Operating Procedures

17.1 Register a New Lease

1. Confirm the Property, Landlord, and Lease Department already exist.
2. Create the lease and complete ownership, term, and financial fields.
3. Add lease contacts.
4. Save and confirm notice deadline and next action date.
5. Upload the signed agreement under Lease Documents.
6. Create the initial rent schedules.

17.2 Start a Renewal

1. Open the lease.
2. Review end date, notice deadline, and latest reminders.
3. Create a Renewal Request.
4. Adjust proposed terms and business justification.
5. Submit for department review.

17.3 Complete an Approved Renewal

1. Confirm the request is in Approved.
2. Upload the supporting Renewal Letter or Approval document.

3. Use Mark Executed.
4. Confirm the successor lease was created if applicable.
5. Add new rent schedules for the successor lease.

17.4 Close Out a Rejected or Terminated Renewal

1. Review the final comment and rejection reason.
2. Confirm whether the original lease should remain active until expiry or be treated as terminating.
3. Update supporting documents and notes as needed.

18. Troubleshooting Tips

- If a user cannot create or edit a Lease, verify their role, assignment or Lease Department User Permission, confidentiality clearance, and the current workflow or document state.
- If a renewal cannot be completed, check for the required Lease Document category.
- If a rent schedule will not save, confirm the currency matches the parent lease and the period stays within lease dates.
- If reminders are not sending, review Settings, the chosen Reminder Policy, and the Reminder Delivery report.
- If a lease status looks outdated, check whether the daily scheduler is running successfully.

19. Good Data Entry Practices

- Use consistent property names, regions, and department codes.
- Always assign a responsible department and officer.
- Enter either monthly rent or annual rent accurately and verify the derived amount.
- Keep lease contacts up to date, especially reminder recipients.
- Upload approval evidence before closing a renewal.
- Review upcoming expiries and upcoming payments at least weekly.

20. Summary

Rent Renewal Tracker is designed to give one controlled process for lease ownership, payment planning, renewal governance, and reminder visibility. The strongest results come from:

- clean setup data
- disciplined use of renewal workflow states
- timely document uploads
- active review of expiry and payment reports
- correct reminder policy configuration

With those controls in place, the app becomes a reliable operating register for lease administration and rent renewal management.

21. Dashboard, Personal Work Queue, and Visual Status Cues

21.1 Dashboard cards and drill-down behavior

The workspace contains permission-aware cards for Expiring in 30 Days, Expiring in 60 Days, Expiring in 90 Days, Renewals Waiting for Me, Overdue Rent Obligations, Failed Reminders, and Annual Rent Exposure. Selecting a card opens the corresponding report with relevant filters. Annual Rent Exposure uses the configured default currency. If no default exists and the visible data contains more than one currency, it displays Multiple currencies instead of adding incomparable amounts.

21.2 Dashboard charts

Lease Expiry Outlook uses the Upcoming Expiries report chart. Renewal Workflow uses the Renewal Pipeline report chart. Both inherit the current user's record-level access; dashboard counts are not intended to reveal inaccessible leases.

21.3 My Actions

My Actions consolidates Renewal Approval, Overdue Payment, Lease Expiry, Document Expiry, and Failed Reminder work. Filter by Action Type or Priority. Critical items sort before High, Medium, and Low; within a priority, the earliest event date sorts first. Renewal approvals become High when older than seven days. Overdue payments become Critical when more than 30 days late. Lease expiries are High within 30 days, Medium within 60, and Low through 90 days. Expired documents and failed reminders are Critical; documents expiring soon are High.

21.4 List and calendar indicators

Lease, Rent Schedule, Renewal Request, and Lease Document list views use colored indicators. Lease and Rent Schedule also provide calendar views. Lease calendar events span Start Date through End Date; Rent Schedule calendar events appear on Due Date. A Restricted lease displays a red access warning. Lease forms show the next contractual action. Renewal forms highlight changed proposed terms and the role currently expected to act. Lease Document forms warn when a document is Expiring Soon or Expired.

22. Security, Permissions, and Information Boundaries

22.1 Layered authorization model

Access is the intersection of four controls: application role, DocType permission, record assignment or department scope, and confidentiality clearance. A user may possess read permission for the Lease DocType and still see no record because the lease is outside the user's assignment, department permission, or clearance level. Guest users receive no application access.

22.2 Unrestricted operational roles

Administrator, System Manager, Rent Renewal System Manager, and Lease Administrator bypass the lease assignment and confidentiality filters. This is operationally powerful; assign these roles only to trusted administrators. It does not change every DocType's create/write permission: the DocType matrix still determines what each role can do.

For Lease Document, default create and submit grants belong to Rent Renewal System Manager, Lease Administrator, and Responsible Officer. Cancel is limited to Rent Renewal System Manager and Lease Administrator; Responsible Officer must escalate cancellation. Administrator retains the Frappe permission bypass. System Manager alone bypasses the record-level filter but cannot create, submit, or cancel because the default Lease Document permission matrix does not grant those actions. Custom grants still require linked-Lease and confidentiality authorization.

22.3 Assigned-user and department access

For scoped users, a lease is visible when the user is the Responsible Officer, Contract Owner, or Backup Officer, or when a Frappe User Permission grants that user the lease's Lease Department. The User Permission must allow Lease Department, match Responsible Department, and either be globally applicable or applicable to Lease. The same rule flows down to Renewal Requests, Rent Schedules, Lease Documents, and Reminder Logs through their Lease link. Lease Documents add their own confidentiality check after the parent Lease check.

When a new Lease is saved, the same scope is evaluated from its proposed values before insertion. Unrestricted operational roles may create without assignment. A Responsible Officer must assign themselves as Responsible Officer, Contract Owner, or Backup Officer, or hold the matching Lease Department User Permission, and the selected classification must be within their clearance. Related records must link to a Lease the user is authorized to access.

22.4 Confidentiality classification and clearance

Confidentiality Classification is a required Lease field and defaults to Internal. It controls how sensitive the entire Lease record is treated. Classification is one access gate rather than a complete permission by itself: a scoped user must also have the required application role and DocType permission and must be assigned as Responsible Officer, Contract Owner, or Backup Officer, or hold the matching Lease Department User Permission.

- **Public:** use for low-sensitivity lease information that may be shared broadly among authorized Rent Renewal Tracker users. Public does not mean internet-public, website-visible, or available to Guest; Guest users receive no application access.
- **Internal:** use for routine operational leases intended for staff inside the organization. This is the recommended default for ordinary leases.
- **Confidential:** use for commercially sensitive leases containing negotiated rents, special terms, sensitive counterparty information, or material internal assessments. This level excludes Lease Viewer.

- Restricted: use only for highly sensitive leases involving litigation, executive matters, investigations, strategic negotiations, exceptional financial terms, or similarly limited information.

Public and Internal currently have the same technical role-clearance boundary. Their difference is the business handling label: Public means broadly shareable within the authorized app population, while Internal records information as ordinary internal-only material. Neither classification bypasses assignment, department scope, DocType permission, or authentication.

Clearance by scoped role is:

- Lease Viewer: Public and Internal.
- Responsible Officer, Department Head, and Finance Approver: Public, Internal, and Confidential.
- Legal Approver, Management Approver, and Lease Auditor: Public, Internal, Confidential, and Restricted.
- Administrator, System Manager, Rent Renewal System Manager, and Lease Administrator: bypass the classification and assignment filters as unrestricted roles, while the normal DocType action matrix still determines what each role may create, write, submit, cancel, export, or delete.

A user with multiple roles receives the union of those clearances. For example, Responsible Officer plus Legal Approver receives create and submit authority from Responsible Officer and Restricted clearance from Legal Approver, but the user must still be assigned to the Lease or hold the matching Lease Department User Permission.

The classification is enforced when leases are listed, opened, created, saved, reported, exported, or counted on permission-aware dashboards. Renewal Requests, Rent Schedules, and Reminder Logs inherit the parent Lease authorization through their Lease link. Lease Documents must pass both the parent Lease classification and the document's separate Internal, Confidential, or Restricted classification, so a user may see a Lease while a stricter linked document and its private file remain hidden. Restricted leases also display a red warning in the Lease form, and a successor Lease created from a completed renewal inherits the predecessor's classification.

Choose the classification before submitting the Lease. Changes to a submitted Lease follow the normal Frappe amendment and document-control process.

22.5 Workflow authorization and segregation of duties

An approver must have the role permitted for the current workflow transition and must be authorized for the lease. The requester cannot approve their own Department, Finance, Legal, or Management review stage. Return and Reject require a comment. Generic Frappe workflow email is disabled because it could attach a full PDF to every role holder; the application instead uses scoped notifications and reminder recipients.

For Renewal Request creation, the default create grant belongs to Rent Renewal System Manager, Lease Administrator, and Responsible Officer, while Administrator retains the Frappe permission bypass. System Manager alone and the review-only roles cannot create a Renewal Request. A Responsible Officer must pass the same assignment or Lease Department scope and confidentiality checks as the linked Lease.

Workflow authority is separate from DocType authority. Rent Renewal System Manager can create a Renewal Request but has no transition assigned to that role alone. Lease Administrator can submit a Draft and mark an Approved request executed, while Department Head, Finance Approver, Legal Approver, and Management Approver act only at their configured stages. Every scoped approver must also pass the linked-Lease authorization check.

22.6 Private files and audit integrity

Lease Documents accept only private files. The user must be able to read the File and either own an unattached upload, own a file attached to the lease/document, use a temporary upload, or have read access to the original attached record. Once attached, Frappe delegates File reads and downloads to the Lease Document permission decision. True Draft files may be corrected before submission; submitted, cancelled, superseded, and legacy evidence cannot be replaced or deleted. Use a revision or standard Frappe amendment instead. Reminder Logs cannot be edited manually and cannot be deleted except during uninstall.

23. Lifecycle Actions: Renewal and Termination

23.1 Start from a lease

On a submitted lease in Active, Expiring Soon, or Expired status, open Lifecycle and select Start Renewal or Start Termination. The application creates a Renewal Request with recommendation Renew or Terminate and opens it. If an open request of the same type already exists, the existing request opens. If the open request is of the other type, complete or cancel it first.

The Lease lifecycle action is the recommended entry point because it applies the submitted/status eligibility checks. Direct Add Renewal Request creation remains available to create-enabled roles but does not currently apply that same eligibility gate. The Lease form may also display the lifecycle button to a read-only user; server-side create permission still prevents unauthorized creation.

23.2 Termination-specific behavior

Termination uses the same approval chain. Outside Draft, Termination Effective Date and Termination Reason are mandatory. The parent lease displays Termination in Progress during the cycle. Before Mark Executed, attach a current private Approval document dated and linked to the lifecycle request. Completion marks the lease Terminated and does not create a successor lease.

23.3 Renewal-specific execution

For Renew, Renegotiate, or Relocate, the approved request requires proposed property, start date, end date, currency, rent basis, and payment frequency before leaving Draft. Before execution, attach a current private Renewal Letter with Document Date and link it to the same Lease and exact Renewal Request. Only Lease Administrator can perform the configured Mark Executed transition. Completion creates one successor lease, links predecessor and successor, copies ownership, contacts, landlord, classification, and selected financial structure, and applies approved proposed terms. Application validation permits one non-cancelled successor while retaining cancelled and amended revision history.

23.4 Cancellation and rejection

Reject is available only at Management Approval and stores the workflow comment as Rejection Reason. Canceling an open request clears the open-cycle key and returns the lease to Active or Expired based on its End Date. Rejection similarly restores the lease's operational status while retaining the request and decision history as evidence.

24. Lease Document Lifecycle and Revision Control

24.1 Supported files and linked authorization

Allowed extensions are CSV, DOCX, JPEG, JPG, PDF, PNG, TXT, and XLSX. The file must be private and within the site's maximum size. Every action also requires the applicable DocType right plus access to the linked Lease, assignment or department scope for scoped users, parent and child confidentiality clearance, and File permission.

24.2 Draft and submit

New records use DocStatus Draft, Revision Status Draft, and Document Status Draft. Saving does not supersede evidence. Rent Renewal System Manager, Lease Administrator, and an authorized Responsible Officer can submit; Administrator has the Frappe bypass. Formal categories require Document Date. Submission makes the revision Current, records the reviser and time, locks the file, calculates expiry status, and only then supersedes the previous revision.

24.3 Revision

Create Revision is available from a submitted Current or legacy-current document to users with create permission and write access to that record. The revision stays on the same Lease, requires a different private file and Revision Reason, inherits the document family, and receives the next revision number. The old revision remains Current while the new record is Draft; it becomes Superseded only after the new revision is submitted.

24.4 Cancel and restore

Cancel is limited by default to Rent Renewal System Manager and Lease Administrator; Responsible Officer can submit but cannot cancel. Enter and save Cancellation Reason first. Only a submitted Current revision can be cancelled. Cancellation retains the record as Cancelled evidence and restores its immediate Superseded predecessor to Current when safe. Superseded revisions cannot be cancelled.

24.5 Standard Frappe amendment

Use Amend after cancellation. Frappe automatically sets Amended From. The amendment remains in the same family, receives the next revision number, must stay on the same Lease, and requires Revision Reason. It remains Draft until submitted. It may reuse the cancelled file for a metadata correction; an ordinary revision must use a new file.

24.6 Expiry, renewal evidence, and legacy compatibility

Daily automation and My Actions ignore Draft and Cancelled records. Submitted Current records receive No Expiry Date, Current, Expiring Soon, or Expired status. Renewal completion accepts only a dated Current document linked to the exact Lease and Renewal Request: submitted evidence for new records, or a legacy-current record retained for

upgrade compatibility. Draft, Superseded, and Cancelled documents do not qualify. Upgrade marks old records Legacy Unsubmitted instead of silently submitting them and aligns only the app-managed Custom DocPerm submit/cancel grants, preserving unrelated custom permission settings.

25. Payment Evidence and Schedule Integrity

Record Payment appends dated, referenced payment rows. The system derives Total Paid, Outstanding Balance, Payment Status, and Schedule Status from those rows; it rejects non-positive payments and overpayment. New schedules can fill blank financial fields from Monthly or Annual lease terms and the lease payment frequency. Unsupported rent bases and Other frequency remain manual rather than using an unsafe assumption. Waived schedules require a waiver reason in Notes. Schedule periods cannot overlap another non-cancelled schedule for the same lease, and must fall within the lease term. Total Due equals Base Rent plus Service Charge plus Tax. The currency must match the lease. After a schedule is submitted, daily automation may refresh status and accept payment evidence without changing submitted commercial values. Upgrade converts legacy Paid schedules into full-value historical payment rows and flags legacy Partially Paid schedules for evidence-based reconciliation without inventing an amount.

26. Reminder Engine, Delivery Audit, and Digest

26.1 Eligibility and threshold selection

The daily engine evaluates leases with an End Date, excluding Draft, Renewed, and Terminated lease statuses and Completed or Not Renewing renewal statuses. It uses the lease-specific Reminder Policy when set, otherwise the default policy. It selects a due enabled threshold that has not already been logged for the lease, renewal cycle, policy, channel, and recipient. This deduplication prevents repeat sends for the same event.

26.2 Recipient resolution

Lease User Field supports `responsible_officer`, `backup_officer`, and `contract_owner`. Lease Contact Type resolves only contacts of the selected type whose Receives Reminders box is selected. Role resolves all enabled users holding that role. Explicit User resolves one enabled user. Email uses a direct validated address. Scope limits a rule to All, Pre-Expiry, Expiry, or Overdue.

26.3 Delivery states and retries

Each delivery is reserved as Queued. A worker claims it as Sending so duplicate workers exit without sending a second message. Success becomes Sent, records Sent At and Message ID, and updates the lease's Last Reminder Date and Next Reminder Date. Failure becomes Failed, records the error and retry count, writes an application error log, notifies configured administrator recipients, and queues another attempt while the retry limit allows.

26.4 Auto-created renewal requests

When Create Renewal Request at First Threshold is enabled, the engine may create one request at the largest enabled pre-expiry threshold if the lease has no last request. It recommends Renegotiate, begins the proposed term the day after the current End Date, and uses approximately the same tenure length.

26.5 Weekly management digest

When enabled, the weekly job emails configured recipients a summary of leases expiring within 90 days, approvals older than seven days, overdue payments, failed reminders, and annual rent exposure grouped by currency. It includes links to My Actions and Renewal Pipeline. If enabled without recipients, the system logs an error instead of sending.

27. Administrative Readiness and Health Controls

Setup Readiness checks for at least one Lease Department, assigned users with core roles, a valid default Reminder Policy, an outgoing Email Account, at least one Property, and at least one Lease. Complete these items before depending on automated reminders. A technical installation health check also verifies the installed app, required DocTypes, roles, workflow states and actions, active workflow, reminder policy, workspace, reports, cards, and charts.

28. Core Role Permission Matrix

Role	Lease	Renewal Request	Rent Schedule	Lease Document	Reminder Policy	Reminder Log	Rent Renewal Settings
Rent Renewal System Manager	R/W/C/S/X/D/E	R/W/C/S/X/D/E	R/W/C/S/X/D/E	R/W/C/S/X/D/E	R/W/C/D/E	R/E	R/W
Lease Administrator	R/W/C/S/X/E	R/W/C/S/X/E	R/W/C/S/X/E	R/W/C/S/X/D/E	R/E	R/E	R
Responsible Officer	R/W/C	R/W/C	R/W/C	R/W/C/S	-	-	-
Department Head	R	R/W	R	R	-	-	-
Finance Approver	R	R/W	R/E	R	-	-	-
Legal Approver	R	R/W	-	R	-	-	-
Management Approver	R/E	R/W/S/X	R	R	-	-	-
Lease Auditor	R/E	R/E	R/E	R/E	R/E	R/E	R
Lease Viewer	R	R	R	R	-	-	-

Legend: R read, W write, C create, S submit, X cancel, D delete, E export. Print/email permissions and master-register detail are omitted from this compact matrix but remain governed by the DocType configuration. Record-level scope and confidentiality still apply.

28.1 Detailed DocType permissions

The following inventory expands the compact matrix and includes every configured role permission for every non-child application DocType. Duplicate permission rows for the same role are combined.

Landlord

Role	Allowed actions
Rent Renewal System Manager	Read, Write, Create, Delete, Print, Email, Export

Action	Data	Read-only	-
To State	Data	Read-only	-
Actor	Link	Read-only	User
Acted On	Datetime	Read-only	-
Comment	Small Text	Read-only	-

30. Glossary and Status Reference

Term	Meaning
DocType	A Frappe record type, comparable to a business object or database-backed form.
Draft / Submitted / Cancelled	Frappe document states 0, 1, and 2. Lease, Rent Schedule, and Lease Document are submittable; workflow may submit Renewal Requests at Approved/Completed.
Lease status	Operational condition of the lease: Draft, Active, Expiring Soon, Renewal in Progress, Termination in Progress, Renewed, Expired, or Terminated.
Renewal status	Summary copied to the lease: Not Started, Draft, Pending Approval, Approved, Rejected, Completed, or Not Renewing.
Workflow state	The detailed approval position on a Renewal Request.
Open cycle	A non-final Renewal Request that reserves the lease so another lifecycle request cannot start.
Reminder threshold	A configured number of days before End Date when an event becomes eligible.
Overdue cadence	The minimum interval, in days, between overdue reminder events.
Confidentiality classification	The required lease-level sensitivity label Public, Internal, Confidential, or Restricted. It works together with role permission and assignment or department scope; Public never means guest or website access.
Document family	All immutable revisions of the same Lease Document.
Successor lease	The new lease created when a non-termination lifecycle request is completed.

31. Go-Live and Operating Checklists

Administrator go-live

- [] Run migrations and installation health checks; confirm the active workflow, reports, workspace, cards, and charts.
- [] Assign roles and department User Permissions; test with representative users at each clearance level.
- [] Configure default currency, thresholds, email sender, retry limit, administrator alerts, and digest settings.
- [] Configure outgoing email and test both email and in-app reminders without exposing restricted records.
- [] Load master data, create sample leases, upload private documents, and validate reports before production import.

Weekly operations

- [] Review My Actions, Upcoming Expiries, Renewal Pipeline, Upcoming Payments, and document-expiry items.
- [] Investigate failed reminders and confirm retries or configuration corrections.
- [] Confirm newly paid schedules carry Payment Reference and Paid On; document every waiver reason.
- [] Confirm approved lifecycle requests have the correct current private document before execution.

Monthly control review

- [] Review role assignments, unrestricted users, department permissions, and Restricted lease access.
- [] Review Reminder Delivery rate and recurring failure causes.
- [] Reconcile Rent Exposure by currency and inspect approaching notice deadlines.
- [] Audit revision chains, superseded documents, and immutable reminder/decision history.

End of knowledge base: Keep this manual with the application release it documents. Rebuild or revise it whenever roles, DocTypes, workflow transitions, reports, scheduler jobs, or validation rules change.
